nonlinear partial differential equations has become one of the main tools of modern mathematical analysis in spite of seemingly contradictory terminology the subject of nonlinear differential equations finds its origins in the theory of linear differential equations and a large part of functional analysis derived its inspiration from the study of linear pdes in recent years several mathematicians have investigated nonlinear equations particularly those of the second order both linear and nonlinear and either in divergence or nondivergence form quasilinear and fully nonlinear differential equations are relevant classes of such equations and have been widely examined in the mathematical literature in this work we present a new family of differential equations called implicit partial differential equations described in detail in the introduction c f chapter 1 it is a class of nonlinear equations that does not include the family of fully nonlinear elliptic pdes we present a new functional analytic method based on the baire category theorem for handling the existence of almost everywhere solutions of these implicit equations the results have been obtained for the most part in recent years and have important applications to the calculus of
